The invention relates to an isolated nucleic acid with at least 80% nucleic acid sequence identity to a nucleotide sequence encoding one of a secreted/transmembrane polypeptides, or PRO polypeptides or a encoding a PRO protein extracellular domain. Also included are a vector comprising the PRO protein extracellular domain. Also included are a vector comprising to polypeptide (by culturing the host cell for the expression of the PRO polypeptide, and recovering the PRO polypeptide (having at least 80% sequence identity to: (a) an isolated PRO polypeptide (having at least 80% sequence identity to: (a) an amino acid sequence selected from the 61 PRO proteins; (b) an amino acid sequence selected from the 61 PRO proteins; (b) an amino acid sequence selected from the 61 PRO proteins; (b) an amino acid sequence anotelic acid molecule deposited with an ATCC number (detailed in the specification); or (c) an extracellular domain of a PRO polypeptide or to a PRO polypeptide or to a PRO polypeptide or to a PRO polypeptide or to a PRO polypeptide or to a PRO polypeptide or to a PRO polypeptide or to a PRO polypeptide or to a PRO polypeptide or to a PRO polypeptide or to a PRO polypeptide or to a PRO polypeptide or to a PRO polypeptide or to a PRO polypeptide or to a PRO polypeptide or to a PRO polypeptide or to a proper protein a sample suspected of containing the polypeptide. In the protein a proper protein a proper protein a proper protein a proper protein and screening of therapeutically useful reagents. The nucleic acids may also be used in gene therapy, in chromosome identification, as chromosome markers, or in generating probes. The PRO polypeptides and nucleic acids may also be used in tissue a protein electrophoresis, and the isolated nucleic acids may be used for recombinantly expressing those markers. The PRO putipodies are useful in diagnostic assays for PRO, and the isolated sources. The present sequence encodes a PRO protein electrophoresis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New transmembrane polypeptides and nucleic acids encoding the polypeptides, useful in gene therapy, in chromosome identification, as chromosome markers, in generating probes and in tissue typing.
                                                                                                                                                                                                                                                                                                                                                                                              , Botstein D, Desnoyers L, Eaton DL, Ferrara N; , Fong S, Gao W, Gerber H, Gerritsen ME, Goddard A; Grimaldi JC, Gurney AL, Hillan KJ, Kljavin IJ; Pan J, Paoni NF, Roy MA, Stewart TA, Tumas D; , Wood WI;

```
The invention describes a new isolated nucleic acid molecule comprising
the full length coding sequence of the DNA deposited with the American
Type Culture Collection (e.g. ATCC Deposit No. 209288), or a sequence
with at least 80% identity to a DNA encoding a PRO polypeptide comprising
any of 61 sequences having 164-1119 amino acids fully defined in the
specification. The PRO polypeptides or polynucleotides are useful as
the parameteristic disposites, biosensors or bioreactors. These are
comparamenticals, diagnostics, biosensors or broreactors. These are
particularly useful for detecting or treating e.g. Parkinson's disease,
comparaticularly useful for detecting or treating e.g. colorectal
cancer), haemorrhage (or reduce risk for haemorrhage), rheumatoid
cancer), haemorrhage (or reduce risk for haemorrhage), rheumatoid
cancer), haemorrhage (or reduce risk for haemorrhage), rheumatoid
crestenosis, dermal fibrotic conditions (e.g. keloids or scarring),
cischaemia, strokes, hypertension, heart attacks, atherosclerosis, or
infertility in mammals (e.g. humans, dogs, cats, cattle, horses, sheep,
cischaemia, strokes, hypertension, heart attacks, atherosclerosis, or
infertility in mammals (e.g. humans, dogs, cats, cattle, horses, sheep,
cischaemia, strokes, hypertension, heart attacks, attherosclerosis, or
infertility in mammals (e.g. humans), dogs, cats, cattle, horses, sheep,
complexence of these diseases. The PRO polypeptides are asfold
as molecular weight markers, or for chromosome identification. The PRO
genes are useful as hybridisation probes, or for screening libraries of
therapy, particularly for replacing a defective gene. This sequence
concepts a novel human secreted and transmembrane PRO polypeptide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           84 GTTCCAGAACTCTCCATCCGGACTAGTTATTGAGCATCTGCCTCTCATATCACCAGTGGC 143
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              New genes and secreted and transmembrane polypeptides (e.g. PRO245 or PRO335), useful for treating or diagnosing e.g. Alzheimer's disease, cancers, hemorrhage, rheumatoid arthritis, diabetes, cirrhosis, ischemia
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             0; Gaps

The invention describes an antibody that specifically binds to a PRO polypeptide having a fully defined amino acid sequence given in the specification. The antibody is useful in identifying PRO polypeptides useful for various industrial applications, including pharmaceuticals, affinity purification of PRO polypeptides from recombinant cell culture or natural sources. The antibody is also used for antagonists, may be used for preparing a medicament for its agonists or antagonists, may be used for preparing a medicament for diagnosing or treating a condition responsive to the antibody, PRO polypeptide, or its agonists. This sequence encodes a novel human secreted and transmembrane PRO polypeptide.
                                                                                                                                                                                                                                            New antibody useful for identifying PRO polypeptides, for affinity purification of PRO polypeptides, and for preparing a medicament for polypeptide or treating conditions responsive to the antibody or PRO polypeptide.

                                                                                                                                                                                                                                        Sequences ABB10981-ABB12330 represent 1350 novel human polypeptides, and sequences ABA08225-ABA09574 represent nucleic acids encoding them. The invention also relates to vectors and recombinant host cells comprising a nucleotide of the invention, methods of producing the nucleotides.

CC introduction of the invention, methods of detecting the nucleotides or polypeptides in a sample, and methods of identifying compounds which bind to polypeptides of the invention. Although movel, many of the polypeptides of the invention have homology to known proteins, thereby giving an insight into their probable biological activities, and hence potential therapeutic applications. The polypeptides of the invention may have various activities, and hence potential therapeutic applications. The polypeptides of the invention may have various activities, sense cell growth factor activities, and hence confidence of chemotactic or chemotactic activities, thromboly.

CC differentiation activities, receptor or inhibin-related activities; information activities, activities, takemactopic or chemotactic or chemotactic activities, activities, takemactopic or chemotactic or chemotactic activities, activities, takemactopic or chemotactic or chemotactic activities, activities, activities, activities, incombination are useful for preventing, treating or metastasis.

C bepending on their biological activities, polypeptides and nucleotides of the inventions include conditions, e.g., by protein or gene therapy. Such conditions include conditions, e.g., by protein or gene therapy. Such conditions include activities activities and about a strain cornelic acids encoding them) may be used to promote wound careating (e.g., of promote wound careating (e.g., of actoprores), chronic inflammatory conditions (e.g., asthma or arthritis), arterial isoname, bound and inflammatory activities may be used in the treatment of viral, bacterial and fungal infections in addition to immune disorders.

Polypeptides with growth factor activity may be used in the treatm
                                                                                                                              Human proteins and DNA encoding sequences useful for preventing, treating or ameliorating a medical condition in a mammalian subject e.g. arthritis and cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       that can be used to augment or replace cells damaged by illness, autoimmune disease or accidental damage. The polypeptides and nucleotides may also be used in the diagnosis of the above conditions, and in drug

Yuan J; ٦, Chen Pennica D, Goddard A, Gurney AL, WPI; 1999-229533/19. N-PSDB; AAX52250. Wood WI,

ŏ New isolated human genes and polypeptides used in, e.g. treatment gastrointestinal ulceration.

Claim 12; Fig 74; 320pp; English

Antistatives represent becreted and trainsender number procession.

CDNA sequences are obtained from CDNA libraries, prepared from fetal

concoded polypeptides have specific uses based on their homology to known

polypeptides. e.g. PRO211 and PRO217 can be used for disorders associated

with the preservation and maintenance of gastrointestinal mucosa and the

colypeptides. e.g. PRO211 and PRO217 can be used for disorders associated

with the preservation and maintenance of gastrointestinal uncosa and the

collinger-Ellison syndrome, gastrointestinal ulceration and congenital

microvillus atrophy, skin diseases associated with abnormal keratinocyte

differentiation (e.g. psoriasis, epithelial cancers such as lung squamous

cell carrinoma of the vulva and gliomas), potent effects on cell growth

can development, diseases related to growth or survival of nerve cells

including Parkinson's disease, Alzheimer's disease, ALS, neuropathies or

cancer. PRO265 can be used as for fibromodulin, e.g. for reducing dermal

cancer. PRO265 can be used as a for fibromodulin, e.g. for reducing dermal

cancer. PRO265 can be used as a for fibromodulin, e.g. for reducing dermal

cancer used in the treatment of Usher Syndrome or Atrophia areata; PRO269 can

be used as an anti-thrombotic agent; PRO287 polypeptides and portions may

have therapeutic applications in wound healing and tissue repair; PRO317

can be used for treating problems of the kidney, userus, endometrium,

blood vessels, or related tissue, e.g. in the heart of genital tract AAY13344-403 represent secreted and transmembrane human proteins. The

AAZ38109 to AAZ98242 encode AAV87224 to AAV87357 which represent the human signal peptide-containing proteins HSPP-1 to HSPP-134. HSPPs have cuttonorer, anti-inflammatory, antimicrobial, nootropic, hepatotropic, neuroprotective, cardiovascular and antiasthmatic activities, and can be used in gene therapy. HSPPs can be used to treat or prevent disorders associated with decreased activity or function of HSPP. Antegonists of CHSPP are used to treat or prevent disorders associated with increased activity or function of HSPP. Such diseases include cell proliferation (including cancer), inflammation, cardiovascular, neurological, reproductive or developmental disorders, (e.g. arteriosclerosis, creproductive or developmental disorders, (e.g. arteriosclerosis, creproductive or developmental disorders, (e.g. arteriosclerosis, asthma, Crohn's disease, microbial or other infections, congestive or ischaemic heart disease, Alzheimer's, Parkinson's or Huntington's asthma, confirming and partery defects, muscular dystrophy). HSPP conclete acids can be used for the recombinant production of HSPP, for detecting HSPP in standard hybridisation and amplification assays (for diagnosis and monitoring), in gene therapy, as antieense, triplex-forming or ribozyme therapeutics, for detecting related sequences or genetic variations, and for chromosomal mapping, HSPP are also used to raise specific antibodies (Ab) and to screen for agonists and antagonists, in competitive drug screens, and for purification of HSPP from natural

The invention relates to a novel nucleic acid encoding a PRO polypeptide. The polypeptides and polynuclectides of the invention may be useful as research tools and as therapeutics for treating enterocolitis, Zollinger-Blison syndrome, gastrointestinal ulceration, psoriasis, cancer, Parkinson's disease, Alzheimer's disease, ALS, neuropathies, dermal scarring and wound healing, nerve repair, thrombosis, bone and/or cartilage formation, angiogenesis, asthma, rheumatoid arthritis, multiple sclerosis, inflammatory disorders, atherosclerosis, cardiac injury, infertility, premature aging, AIDS, diabetes complications and stroke. The molecules may also be utilised during gene therapy procedures and transgenic animal production. The current sequence is that of the human PRO protein of the invention.
                                                                                                                            Novel nucleic acids encoding secreted and transmembrane polypeptides with homology, e.g. to growth and cancer-associated antigens.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      140
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      482

The present sequence is one of sixty one novel secreted and transmembrane PRO polypeptides. The PRO polypeptides are useful for treating skin diseases (e.g. psoriasis), cancers (e.g. lung squamous cell carcinoma), gastrointestinal disorders (e.g. enterocolitis), neurodegenerative diseases (e.g. Alzheimer's disease, Parkinson's disease), wound repair, cardiovascular disorders (e.g. endometrial bleeding angiogenesis, ischaemias such as coronary ischaemia, atherosclerosis), inflammatory disorders (e.g. asthma, rheumatoid arthritis, multiple sclerosis) inflammatory infertility, AIDS and diabates and retinal disorders such as retinitis phymentosum. The PRO nucleic acids have applications in molecular biology, including use as hybridization probes, and in chromosome and

The present sequence is a human PRO polypeptide (secreted and transmembrane). The PRO protein, and PRO agonists, PRO antagonists or anti-PRO antibodies are useful for preparation of a medicament useful in the treatment of a condition which is responsive to the PRO protein, agonists, antagonists or anti-PRO antibodies. The PRO protein may also be employed as molecular weight markers for protein electrophoresis. The PRO coding sequence has applications in molecular biology, including use as hybridisation probes, and in chromosome and gene mapping
                                                                                                                                  Eighty four nucleic acids encoding PRO polypeptides, useful in molecular biology, including use as hybridization probes, and in chromosome and

AAF62232 - AAF62235 which are used to isolate the cDNA sequences of the invention. The invention also includes methods for the production of antibodies directed against the proteins, and cDNA sequences, which can be used in vaccines. The polyunclectide sequences can be used in gene therapy. The polyunclectide sequences and the proteins they encode may be used in the prevention, treatment and diagnosis of diseases associated with inappropriate secretory protein/membrane protein expression. The nucleic acids and complementary sequences may also be used as DNA probes in diagnostic assays (e.g. polymerase chain reactions (PCR) to detect and quantitate the presence of similar nucleic acid sequences in samples. They may also be used as antigens in the production of secretory proteins/membrane polypeptides and their role in metabolism. The polypeptides may be used as antigens in the production of antibodies against them and in assays to identify modulators (agonists and activity. The antibodies may also be used as therapeutic agents to down regulate expression and activity. The antibodies may also be used as therapeutic agents to down regulate expression and activity. The production of antibodies may also be used as therapeutic agents to down regulate expression and activity. The properties in samples (e.g. by enzyme linked immunosorbant assay (ELISA). Examples of diseases which may be treated include rheumatoid arthritis and diabetes
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               362
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                100

Consider anothing the proteins are designated as A, B, C or D in a sample cuspected of containing an A, B, C or D plypeptide designated as A, B, C or D in a sample cuspected of containing an A, B, C or D plypeptide, by contacting the sample with a polypeptide designated as B, F, G, H or I/I polypeptide designated as B, F, G, H or I/I polypeptide designated as B, F, G, H or I/I polypeptide conjugate in the sample, where the formation of the conjugate is the presence of an A, B, C or D polypeptide, I polypeptide (C conjugate in the sample, where the formation of the conjugate is a PRO1096 polypeptide, D is a PRO19760 polypeptide, E is a PRO5011 polypeptide, C is a PRO1096 polypeptide, D is a PRO19760 polypeptide, E is a PRO5011 polypeptide, D is a PRO19760 polypeptide, E is a PRO5011 polypeptide, D is a PRO19760 polypeptide, D is a PRO19760 polypeptide, E is a PRO5011 polypeptide, D is a PRO19760 polypeptide, E is a PRO5011 polypeptide, D is a PRO19760 polypeptide, D is a PRO19760 polypeptide, D is a PRO19760 polypeptide and I is a PRO19760 polypeptide, E is a PRO5011 polypeptide, D is a PRO19760 polypeptide and I is a PRO19760 polypeptide designated as A, B, C or D or C is a C is a processing a polypeptide designated as A, B, C or D or C is a proposes, and as therapeutic approximate for treathing apporter artiflage defects, osteoarthritis are useful in the trapeutic apporter for proteins are useful to proposes, and as therapeutic apporter another proposes, and as therapeu for chromosome development and screening of therapeutic useful reagents, for chromosom identification, and in gene therapy. The antibody is useful as a therapyentic agent, in a diagnostic assay and for affinity purification the protein from recombinant cell culture natural sources. The present sequence represents a novel secreted or transmembrane protein of the peptide. Also included are the nucleic lacking its associated signal

One hundred and eighty seven nucleic acids encoding PRO polypeptides, useful in diagnosis and treatment of cardiovascular (e.g. myocardial infarction), endothelial or angiogenic disorders in a mammal.

ABL88072 to ABL88258 encode the PRO proteins given in ABB84817 to ABL885003. The PRO proteins and polynucleotides have cardiant, cytostatic, antiangiogenic, hypotensive, vulnerary and antiarteriosclerotic activities, and can be used in gene therapy. The PRO polynucleotides, proteins, agonists and antagonists are useful for treating or diagnosing a cardiovascular, endothelial or angiogenic disorder in a mammal, e.g. cardiovascular, endothelial or angiogenic disorder in a mammal, e.g. cardiac hypertrophy, trauma, cancer, age-related macular degeneration, atherosclerosis, hypertension, arterial restenosis, rheumatoid arthritis, angina, mycoardial infarctions, thrombophebitis, lymphangitis, tumour angiogenesis (such as breast carcinoma and liver carcinoma) and wound healing. The PRO polynucleotides have applications in molecular biology, including use as hybridisation probes, and in chromosome and gene mapping. ABL88259 to ABL88267 represent primers and probes used in the exemplification of the present invention

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          à
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       엄
                                                                                                                                                                  The invention relates to human PRO polypeptides (secreted or transmembrane polypeptides) and the polynucleotides encoding them. The PRO polypeptides and polynucleotides can be used in treating pathological disorders and tumours, in therapeutic treatment of cardiac insufficiency disorders and tumours, in therapeutic treatment of disorders insufficiency carecters and in therapeutic treatment of disorders insufficiency carecters and in therapeutic treatment of disorders insufficiency carecters associated with the preservation and maintenance of gastrointestinal mucosa and the repair of acute and chronic mucosal caleions, and shin diseases associated with abnormal keratinocyte differentiation (e.g., psoriases, epithelial cancers such as lung squamous cell carcinoma, epidermoid carcinoma of the vulva and gliomas). The sequences can be used as molecular markers for protein calectrophoresis purposes and can be utilised in protein-protein binding assays, biochemical screening assays, immunoassays and cell-based assays. This sequence represents a human PRO polypeptide of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         140

WPI; 2003-361832/34. N-PSDB; ACA58457.

New isolated nucleic acid encoding a PRO polypeptide, e.g. PRO245 or PRO1868, useful in molecular biology, chromosome and gene mapping, in generating antisense RNA and DNA, and in gene therapy.

and transmembrane proteins (PRO polypeptides), and the polymucleotide sequences encoding them. The polymucleotide sequences are useful in molecular biology, as hybridisation probes, in chromosome and gene mapping, in generating antisense RNA and DNA, and in gene therapy. The polymucleotide sequences may also be used in preparing PRO polypeptides by recombinant techniques, and in generating either transgenic animals or knock-out animals which, in turn, are useful in the development and screening of therapeutically useful reagents. The PRO polypeptides or their antibodies are useful in preparing a medicament for treating a condition responsive to the polypeptide or antibody, such as cancer, Allzheimer's disease or ischaemia, and in various diagnostic assays.

ABU71445-ABU71505 represent human PRO polypeptides of the invention 100 242 362 422 542 140 GICCAAGGCTCTTTGCGTGCAGAAGAGCTTTCCATCCAGGTGTCATGCAGAATTATGGGG 302 482 120 602 662 40 9 80 secreted 21 ValGlnGlySerLeuArgAlaGluGluLeuSerIleGlnValSerCysArgIleMetGly IleThrLeuValSerLysLysAlaAsnGlnGlnLeuAsnPhcThrGluAlaLysGluAla ATCACCCTTGTGAGCAAAAAGGCGAACCAGCTGAATTTCACAGAAGCTAAGGAGGCC AGCTTTGAAACTTGCAGCTATGGCTTGGAGATGGATTCGTGGTCATCTTAGGATT AGCCCAAACCCCAAGTGTGGGAAAAATGGGGTGGGTGTCCTGATTTGGAAGGTTCCAGTG AGCCGACAGTTTGCAGCCTATTGTTACAACTCATCTGATACTTGGACTAACTCGTGCATT SerArgGlnPheAlaAlaTyrCysTyrAsnSerSerAspThrTrpThrAsnSerCysIle CCAGAAATTATCACCACCAAAGATCCCATATTCAACACTCCAAACTGCAACACAAACA TGTAGGCTGCTGGGACTAAGTTTGGCCGGCAAGGACCAAGTTGAAACAGCCTTGAAAGCT novel human 322 The present invention relates to the isolation of Conservative: Mismatches: Indels: Length: Matches: Gaps: US-10-079-111-2 (1-2029) x ABU71480 (1-322) Fig 74; 474pp; English. 3.74e-163 1657.00 100.00% 100.00% 45.98% Percent Similarity: Best Local Similarity: Sequence 322 AA; Alignment Scores: Pred. ```
The invention relates to an isolated nucleic acid with at least 80% nucleic acid sequence identity to a nucleotide sequence encoding one of 61 secreted/transmembrane polypeptides, or PRO polypeptides or encoding PRO protein extracellular domain. Also included are a vector comprising
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Claim 12; Fig 74; 484pp; English.

Ä

the PRO nucleic acid, a host cell comprising the vector, producing a PRO polypeptide (by culturing the host cell for the expression of the PRO polypeptide (by culturing the PRO polypeptide from the cell culture), an isolated PRO polypeptide (having at least 804 sequence identity to: (C a) an amino acid sequence selected from the 61 PRO proteins; (b) an amino acid sequence encoded by a nucleic acid molecule deposited with an ATCC number (detailed in the specification); or (C) an extracellular domain of a PRO polypeptide or to a PRO polypeptide lacking its associated signal peptide), a chimaeric molecule comprising a PRO polypeptide of fused to a heterologous amino acid sequence, an anti-PRO antibody, detecting a PRO peptide), a chimaeric molecule comprising a PRO polypeptide of fused to a cell expressing an PRO245 or PRO1868 and consistent and seample suspected of containing the polypeptide, inking a bioactive molecule to a cell expressing a PRO245 or PRO1868. Nucleic acids which encode PRO can be used to generate either transgenic animals or knock-out animals which may be used in the cacles which encode PRO can be used to generate either acids may also be used in gene therapy, in chromosome identification, as chromosome markers, or in generating probes. The PRO polypeptides and nucleic acids may also be used in diagnostic assays for PRO, and in contines are useful in diagnostic assays for PRO, and in contines. The present seminant encombinant cell culture or natural sources. The propers sources. The present sequence represents a PRO protein

                                                                                                                                                                                                                                                                                            6-SEP-1998
                                                                                                                                                                                                                                                                                                                                                 05-OCT-1999
```

The invention describes a new isolated nucleic acid molecule comprising
the full length coding sequence of the DNA deposited with the American
the full length coding sequence of the DNA deposited with the American
consisted the full length coding sequence of the DNA deposited with the American
with at least 80% identity to a DNA encoding a PRO polypeptide comprising
any of 61 sequences having 164-1119 amino acids fully defined in the
specification. The PRO polypeptides or polynucleotides are useful as
particularly useful for detecting or treating e.g. Parkinson's disease,
constriction and provides of particularly useful for detecting or treating e.g. Parkinson's disease,
Alzheimer's disease, inflammations, nephritis, wound healing, nerve
constriction, dammatoid or reduce risk for hemorrhage), rheumatoid
cancer), haemorrhage (or reduce risk for hemorrhage), rheumatoid
cancer), haemorrhage (or reduce risk for hemorrhage), rheumatoid
carthritis, diabetes, cirrhosis of the liver, fibrosis of the lungs,
csetenosis, dermal fibrotic conditions (e.g. keloids or scarring),
cischaemia, strokes, hypertension, heart attacks, atherosclerosis, or
cintertility in mammals (e.g. humans, dogs, cats, cattle, horses, sheep,
confirmed the presence of these diseases. The PRO polypeptides are useful as tryets for
therapeutic intervention in these diseases, and diagnostic determination
cof the presence of these diseases. The PRO polypeptides are also useful
as molecular weight markers, or for chromosome identification. The PRO
consumed the presence of these diseases. The PRO polypeptides are also useful
chuman cDNA, genomic DNA or mRNA. The PRO genes may also be used in gene
charapy, particularly for replacing a defective gene. This is the amino
consumed the presence of a novel human secreted and transmembrane PRO polypeptide New genes and secreted and transmembrane polypeptides (e.g. PRO245 or PRO335), useful for treating or diagnosing e.g. Alzheimer's disease, cancers, hemorrhage, rheumatoid arthritis, diabetes, cirrhosis, ischemia Length:

The invention describes an antibody that specifically binds to a PRO polypeptide having a fully defined amino acid sequence given in the specification. The antibody is useful in identifying PRO polypeptides useful for various industrial applications, including pharmaceuticals, diagnostics, biosensors and bioreactors. The antibody is also used for affinity purification of PRO polypeptides from recombinant cell culture or natural sources. The antibody, PRO polypeptide, or its agonists or antagonists, may be used for preparing a medicament for diagnosing or treating a condition responsive to the antibody, PRO polypeptide, or its agonists or antagonists. This is the amino acid sequence of a novel human secreted and transmembrane PRO polypeptide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                           302
